

## VW Trunk Latch Actuator Bracket Repair Kit

Part# 1J5 827 567 A-PRM

### OEM Design

The trunk release actuator found in the VW Jetta MK4 is known for breaking the plastic pivot lever, which completely disables the latch release mechanism. Repair typically requires replacement of the entire actuator bracket, which is no more durable than the original failure-prone assembly.

### Problems

- Plastic actuator pivot lever breaks easily, particularly during cold weather
- Replacement of OE bracket assembly is a costly yet temporary repair, and doesn't resolve the fragile pivot lever issue

### ÜRO Solution

ÜRO Parts redesigned the plastic actuator pivot lever using metal for vastly improved reliability. The ÜRO lever is made of durable aluminum reinforced with structural ribs, making the ÜRO lever several times stronger than OE. Now you can permanently repair the actuator bracket instead of replacing it!

### Advantages

- Improved design corrects OE deficiencies
- ÜRO pivot lever is simple to install
- Aluminum material is impervious to summer heat and winter cold
- Lifetime warranty

### Vehicle Applications

1999-2005 Volkswagen Bora and Jetta MK4
